

FAST FACTS: Non-Drug Treatment: Distraction

Distraction is the process of drawing a person's attention away from one thought, object, or experience and toward a different thought, object, or experience. Distraction may decrease the experience of pain because of a person's ability to process only so much information at one time.

✓ **Benefits of Distraction:**

- Decreasing pain
- Increasing relaxation
- Providing an opportunity to spend enjoyable time with other people

✓ **Potential Problems with Distraction:**

- When distraction successfully relieves pain, some people may doubt the presence or severity of the pain
- The individual may become even more aware of pain when the distraction ends
- The individual must be ready for and interested in using distraction as a pain relief technique

✓ **Methods of Distraction:**

- Watching TV or movies
- Petting an animal
- Playing games
- Listening to music
- Looking at pictures. Pictures may be used in the following way:
 - Fill a folder or box with pictures from magazines or calendars or old photos
 - Keep the folder or box on hand and bring it out when you need something to do
 - Look at a picture and describe it or think about what is happening in the photo
- Use of Humor. Humor may be used in the following way:
 - Create a humor library; cut out favorite cartoons, sayings, jokes, or quotes and put them in an album or folder; bring it out when your loved one needs a distraction
 - Watch portions of a funny movie
 - Read sections of a funny book out loud

✓ **What Else You Should Do**

- Write down and share information about your pain with your healthcare provider
- Use a [Pain Diary](#) to note important information useful to the healthcare provider
- Try a non-drug treatment and document the impact in your Pain Diary
