

FAST FACTS: Chest Pain

Chest pain is any pain located in the chest and does not need to be heart-related. Chest pain is common in older adults and causes people to worry because of the potential association with the heart. It is sometimes difficult to tell heart pain from other types of chest pain.

Chest Pain Description

- Cardiac (heart-related) pain is typically described as pressure and squeezing of the heart area.
- Non-cardiac (non-heart related) pain is often described as sharp, burning, or painful if someone taps or puts gentle pressure on the chest.
- Older adults and women do not always have typical symptoms.

Potential Causes/Treatment - Cardiac-Related Chest Pain

- Lack of oxygen to the heart
 - Described as heaviness, pressure, squeezing, or pain in left arm
 - More common in men over 60
 - Treatment: Improved or relieved with additional oxygen or nitroglycerine medication
- Inflammation of the membrane around the heart
 - Often sharp intense pain starting in the abdomen/back; may travel to thigh/scrotum
 - May or may not have fever; heart rate typically higher; NOT relived by oxygen
 - Treatment: Medication typically needed
- Painful heartbeat
 - Occasionally have chest pain but usually no symptoms
 - Treatment: Medication

Potential Causes/Treatment - Non-Cardiac Chest Pain

- Pulmonary (related to lungs)
 - Often described as sharp, intermittent pain; can be worse with breathing
 - May have shortness of breath and rapid heartbeat
 - Treatment: Oxygen may help; Ibuprofen, acetaminophen, or other pain medications
- Gastrointestinal (related to digestive system)
 - Often causes sharp intense pain which is not relived by oxygen
 - May or may not also have a fever; heartrate typically elevated
 - Treatment: Medication typically needed
- Musculoskeletal (related to bones and muscles)
 - Pain is usually sudden and localized; could be associated with muscle trauma or a severe cough
 - Pain worse with deep breath
 - Treatment: Ice or heat may help; Ibuprofen may also help
- Chest wall pain
 - Pain is usually sudden and localized; could be associated with a trauma to a muscle or from a severe cough
 - Pain is worse with deep breath
 - Treatment: Ice or heat; non-steroidal anti-inflammatory medications may also help
- Mental or emotional
 - Symptoms do not fit with physical signs
 - Treatment: relaxation, oxygen, massage

Additional Interventions

- Instruct on how to use a [Pain Diary](#) to note important information useful to the healthcare provider.
- Attempt the non-pharmacological treatments (such as those outlined on the page [Low-Risk Pain Treatments](#)) and document their impact on pain and record in the Pain Diary.
