Nondrug Pain and Symptom Management

POSITIONING

POSITIONING – assisting patient to stay in comfortable positions.

- Helps with pain management
- Decreases risk of complications such as bedsores
- Helps maintain range of motion (gently bend and straighten arms and legs while helping patient turn – don’t force joints or muscles beyond a place of comfort). Use patient’s reactions as a guide.

Guidelines for positioning and stretching:

- Use pillows to support patient
  - Make sure ear is flat on pillow and not turned under when patient is on his side
  - Full body pillow can be used to position patient on side
- If able to sit up, suggest to patient that he pretend to “write” the alphabet in the air using feet or arms.
  - Can alternate arms or feet writing six letters at a time
    - Example: Right foot – A, B, C, D, E, F

NOTE: The RN or CNA should only administer non-drug therapies that are within his/her particular scope of practice. Please follow the policies and procedures of your facility regarding administration of non-drug therapies.
